Docker App

March 07, 2022

The goal is to set a project for Docker

The app has php myadmin, mysql and apache.

How it works

Make sure you have Docker installed on your local machine.

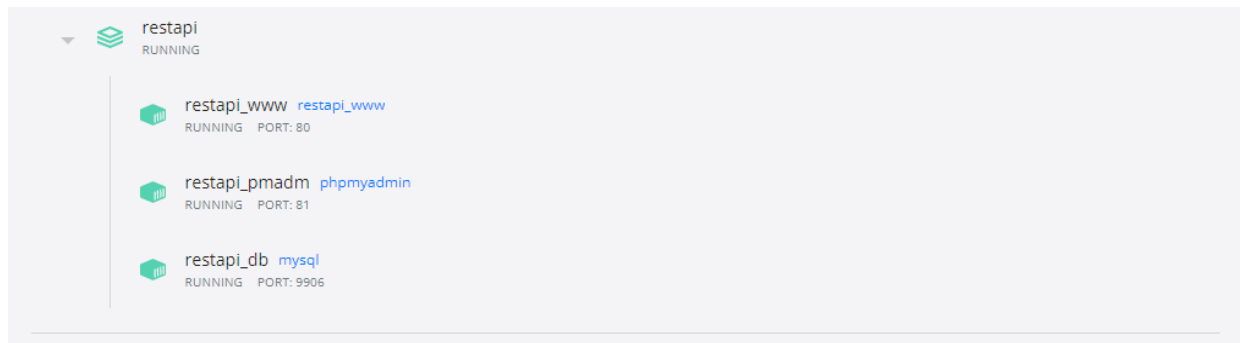

Download the project from <https://github.com/VladULazarev/projects.git>

Open your terminal and check if you are in the project directory.

In the terminal run the following command: **docker-compose up -d**

Wait for installation to be completed.

You will see something like this:

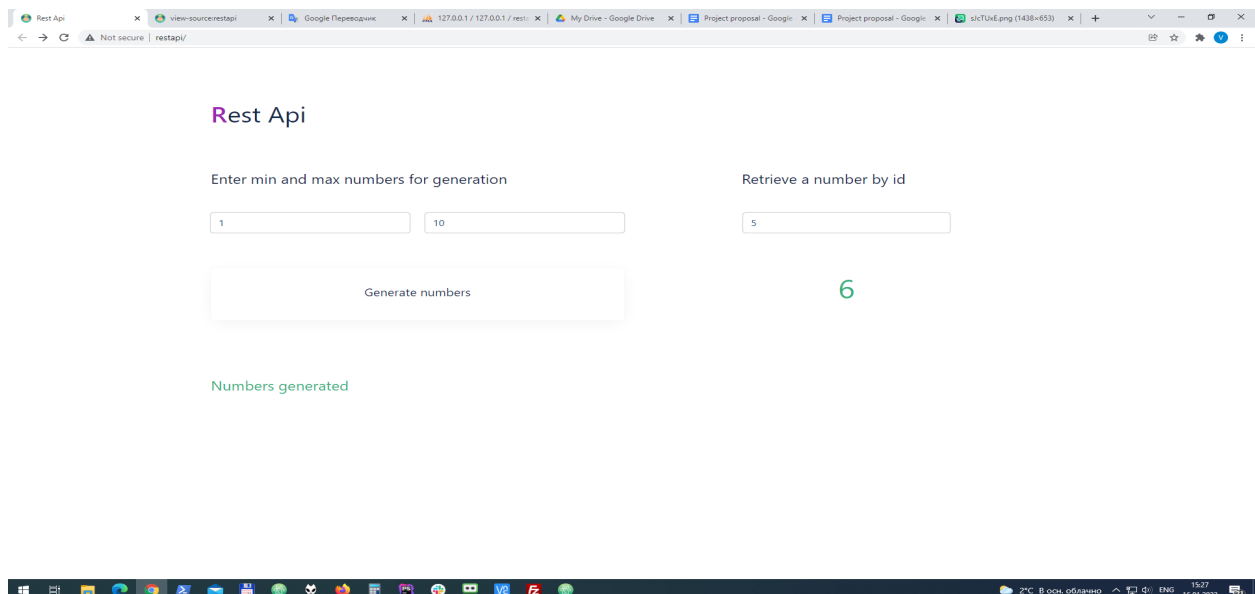

The name of the project folder is **restapi**, but you can name it as you wish.

Open PHP MyAdmin from docker Dashboard.

login: **root**, password: **root**

Open the DB **restapi** and import the table **restapi.sql** from the root directory of the project.

Now you can open the project in your browser on <http://localhost>

See the description of the app in [read_me.pdf](#)
