Docker App

The goal is to set a project for Docker

How it works

Make sure you have Docker installed on your local machine.

Download demo_docker.zip from:

https://github.com/VladULazarev/projects/tree/main/project_three, unzip it into your project directory.

Open your terminal and check if you are in the project directory.

In the terminal run the following command: docker-compose up -d

Wait for installation to be completed.

In Docker Desktop you will see something like this:

The name of the project folder is **demo_docker**, but you can name it as you wish.

Open PHPMyAdmin from Docker Dashboard.

login: root, password: root

Open the DB **demodocker** and import the **demodocker.sql** file from the root directory of the project.

Now you can open the project in your browser on http://localhost

In the terminal:

```
PS C:\projects> cd demo_docker>
PS C:\projects\demo_docker> docker-compose up -d

[*] Running 4/4

- Network demo_docker_default
- Container demodocker_deb

```

How the app works

You need to enter the minimum and maximum values for generating random numbers and click on 'Generate numbers'.

For example, if you enter 2 and 10 respectively, then nine random numbers will be generated and nine rows will be written to the table, where 'id' will be from 1 to 9, and random numbers from 2 to 10 will be written to 'rand_num'.

The previous generation will be removed. To get a number, you need to enter any 'id' from 1 to 9 in the 'Retrieve a number by id' field. The script will work if you enter at least one digit.
